

Task 14 — Fairness, Bias Audit & Explainability

Objective: Measure outcome disparities across relevant groups and establish a defensible continuous monitoring framework.

No disparity results were available because the uploaded dataset did not contain sufficient real observations.

Methodology

Outcome rates are calculated separately for the defined groups. Disparity is reported using absolute percentage-point differences and minimum-to-maximum ratios. These statistics describe observed differences and do not by themselves establish their cause.

Monitoring

Fairness should be monitored continuously using the same definitions, with sample-size checks, uncertainty assessment, data-quality checks, and documented review actions when monitored measures change materially.

Data limitation: Results are calculated only from the uploaded records. Missing production data is not replaced with synthetic observations.
