

Task 14 — Fairness, Bias Audit & Explainability

PlaceMux — Data Analyst Submission Report

Purpose

Measure outcome disparities across relevant groups, document the methodology and limitations, and define continuous fairness monitoring.

Required analysis

- Outcome-disparity analysis across relevant groups.
- Defensible methodology: metric choice, proxies, limitations, and consent.
- Continuous monitoring rather than a one-time fairness audit.
- Trace every disparity metric to source events and a concrete monitoring/action rule.

Data requirement

Use approved, real PlaceMux records and only group attributes permitted for fairness analysis. Document consent, proxy limitations, sample sizes, and uncertainty before interpreting disparities.

CSV structure

Column	Purpose
event_id	Unique decision/exposure event identifier.
event_timestamp	Time of the event.
candidate_id	Candidate identifier.
job_id	Job identifier.
group	Fairness grouping variable.
group_value	Observed group category/value.
search_exposure	Whether the candidate was exposed to search results.
result_shown	Whether a result/recommendation was shown.
clicked	Whether the candidate clicked.
application_started	Whether an application was started.
application_submitted	Whether an application was submitted.
selected	Whether the candidate was selected.
rejected	Whether the candidate was rejected.
model_score	Model/recommendation score, where applicable.
human_review	Whether human review occurred.
explanation_shown	Whether an explanation was shown.

Submission note

This report is a data-ready submission draft. The screenshots define the task requirements, but they do not contain the underlying production event records. No performance or fairness numbers have been fabricated. Populate the CSV with the real PlaceMux data, run the analysis, and replace the results section with the measured values.
